

ByteQuest - Revisions To-Do List

Implementation-ready checklist derived from the requested revision notes. Use item IDs (BQ-001 onward) when assigning work, validating existing features, or reporting completion.

Document	new-bytequest-revisions-to-do-list.pdf
Purpose	Reference checklist for development, QA, and Codex CLI implementation
Status values	[] Not started [~] Partially implemented [x] Implemented [!] Blocked / needs clarification

Priority guide

P0 - Critical: core compliance, authorization, or workflow behavior. P1 - High: major instructor/admin/student functionality. P2 - Medium: learning experience and UI refinements. P3 - Enhancement: optional polish or future iteration.

A. TESDA alignment, modules, and scoring

[] BQ-001	P0	Verify the NC II module structure against the applicable TESDA booklet/reference for the specific qualification.	Document the exact TESDA reference/qualification used; module names, sequence, and required components are traceable to that source.	Audit first; do not invent standards.
[] BQ-002	P0	Review the grading/scoring model and align it with the applicable TESDA assessment/pointing rules.	Every scored activity has a documented scoring rule and traceability to the chosen TESDA reference.	Audit rules, formulas, caps, and rounding.
[] BQ-003	P0	Implement the TESDA-based points system wherever the application currently calculates or displays points.	UI totals, stored scores, and reports use one consistent TESDA-aligned calculation.	Run test cases at minimum, maximum, and boundary scores.
[] BQ-004	P1	Add a clear configuration/reference layer for the TESDA source/version used by the application.	The codebase documents which TESDA material/version the grading logic is based on.	Keep source/version visible in developer documentation or config.

B. Role separation: Admin vs Instructor

[] BQ-005	P0	Create/verify a distinct Instructor workflow/interface for issues and operations instructors are authorized to handle.	Instructor permissions are isolated from Admin permissions and enforced server-side.	Test direct URL/API access, not just hidden UI controls.
[] BQ-006	P0	Create/verify an Admin workflow/interface for internal administrative problems and system management.	Admin-only functions cannot be performed by Instructor accounts.	Test role-based authorization on every protected action.
[] BQ-007	P0	Allow Instructor to bypass/advance past COC 1-4 only where explicitly permitted by the system rules.	A controlled bypass exists, is auditable, and cannot be triggered by unauthorized roles.	Log user, timestamp, reason, and affected COC stage.
[] BQ-008	P1	Allow Instructor to edit a previously entered student score when the score is wrong.	Instructor can correct a score within authorized scope.	Validate authorization and prevent editing outside assigned classes/activities.
[] BQ-009	P1	Record score-change history whenever an Instructor edits a score.	Audit trail stores previous score, new score, editor, timestamp, and reason if required.	Verify immutable audit history.
[] BQ-010	P1	Show/record how many points an Instructor awarded for an assessment/activity.	Awarded points are visible and linked to the relevant student, activity, and instructor.	Check consistency between displayed and stored values.

C. Student lifecycle and administrative controls

ID	PR	Feature Requirement	Acceptance criteria	Verification
[] BQ-011	P1	Allow Instructor to deactivate students without deleting them.	Deactivation changes account/status while preserving the student record and history.	Verify the student cannot participate when inactive, but records remain intact.
[] BQ-012	P0	Allow Admin to remove/deactivate/delete instructors and students according to the approved account lifecycle policy.	Admin has the required removal controls; behavior is documented and audited.	Confirm data-retention rules before destructive actions.
[] BQ-013	P1	Prevent Instructor from permanently deleting students.	Instructor UI/API has no destructive student-delete capability.	Attempt direct endpoint access with Instructor credentials.

D. Practical demonstrations and interactive scenarios

ID	PR	Feature Requirement	Acceptance criteria	Verification
[] BQ-014	P1	Add zoom-in/close-focus behavior to the actual practical demonstration area.	Users can enlarge the demonstration/task area without breaking controls or layout.	Test desktop and mobile/responsive states.
[] BQ-015	P1	Remove/hide the draggable boxes/containers once a student begins the drag-and-drop interaction, according to the intended game flow.	Drag targets/containers do not remain visually cluttered after the interaction starts.	Test reset, retry, and completion states.
[] BQ-016	P1	Support scenario-based activities using either video or text scenarios.	Scenario content can be configured as video, text, or both where supported.	Test loading, fallback, and completion behavior.
[] BQ-017	P1	Upgrade scenario-based activities so they are genuinely interactive, not only drag-and-drop.	At least one meaningful interactive mechanic exists (for example choices, timed actions, branching steps, or feedback-driven actions).	Define completion and scoring behavior for the mechanic.

E. Generative AI for quiz creation

ID	PR	Feature Requirement	Acceptance criteria	Verification
[] BQ-018	P1	Add a suitable AI-assisted quiz generation feature for Instructors.	Instructor can request a quiz from permitted course/module context and review the result before publishing.	Keep human review/edit/publish as a controlled step unless explicitly designed otherwise.
[] BQ-019	P1	Allow Instructor to edit/regenerate AI-created questions before assigning them.	Instructor can modify questions, answers, explanations, difficulty, and scoring before publication.	Verify regeneration does not silently overwrite approved content.
[] BQ-020	P1	Add safeguards around AI-generated quiz content.	Generated quizzes have validation for duplicates, missing answers, malformed questions, and unsupported content.	Log generation metadata needed for troubleshooting.

F. LMS-style classes and learning management

ID	PR	Feature Requirement	Acceptance criteria	Verification
[] BQ-021	P1	Create Instructor-managed classes similar to an LMS.	Instructor can create/manage classes within authorized scope.	Verify class ownership/authorization.
[] BQ-022	P1	Allow Instructor to enroll students in a class.	Instructor can enroll eligible students and view membership.	Prevent unauthorized cross-class enrollment.
[] BQ-023	P1	Provide a student class area where enrolled students access assigned learning activities.	Students see only classes and materials they are authorized to access.	Test active/inactive student states.

		Requirement	Acceptance criteria	Verification
[] BQ-024	P1	Allow Instructor to upload files and learning materials.	Supported files upload successfully, are associated with the correct class/module, and can be accessed by authorized students.	Validate size/type/security rules.
[] BQ-025	P1	Allow Instructor to monitor student progress using class/material/activity data.	Instructor has a progress view with meaningful completion/performance indicators.	Verify data reflects actual stored activity results.

G. UI scale and visual cleanup

		Requirement	Acceptance criteria	Verification
[] BQ-026	P2	Minimize logos within learning activities where they are visually oversized.	Logos are reduced to a proportionate size while remaining legible.	Check all activity states and responsive breakpoints.
[] BQ-027	P2	Minimize character/figure illustrations that are currently too large.	Figures fit the intended interaction area and do not obscure controls/content.	Check all scenario/game screens.
[] BQ-028	P2	Perform a final visual consistency pass after functional changes.	Spacing, hierarchy, typography, controls, and interactive states are consistent across Instructor, Admin, and Student views.	Run a browser-based UI regression pass.

H. Cross-cutting QA and implementation discipline

		Requirement	Acceptance criteria	Verification
[] BQ-029	P0	Audit the existing codebase before implementing any item and mark each item as Implemented, Partially Implemented, Not Implemented, or Blocked.	No duplicate implementation work is done blindly.	Produce an evidence-based status report with file paths and relevant functions/components.
[] BQ-030	P0	Map each changed requirement to affected frontend, backend, database, authorization, and test areas.	Each implemented item has a traceable change map.	Document files, routes/API endpoints, tables/models, and tests.
[] BQ-031	P0	Add or update automated/manual tests for each implemented P0/P1 item.	Critical workflows pass regression tests.	Include authorization, validation, edge cases, and persistence checks.
[] BQ-032	P0	Do not remove or rewrite working functionality unless required by an identified conflict with the revision list.	Existing features remain intact unless a change is necessary and documented.	Compare baseline behavior before/after changes.

Recommended implementation order

1) BQ-029 audit first. 2) P0 compliance/authorization/scoring items. 3) P1 LMS, instructor, AI, and interactive learning features. 4) P2 visual refinements. 5) Regression testing and final acceptance. This order is intended to reduce duplicate work and protect existing functionality.

Important: “TESDA-based” should be tied to the exact qualification, booklet/module, and assessment reference actually approved for the project. The checklist intentionally does not invent TESDA rules that were not supplied in the revision note.
